Education

Wilfrid Laurier University

Bachelor of Computer Science, Big Data Concentration

Waterloo, ON, Canada

Sept. 2024 – April. 2028 (Expected)

- **Relevant Coursework:** Data Structures, OOP, Data Visualization, Discrete Structures, Calculus
- **Clubs:** Laurier Analytics Society - VP of Technology | Laurier Computing Society - VP of Finance

Professional Experience

DOUBL

Junior Software Engineer

Toronto, ON, Canada

Jan. 2026 – Present

- Developed a role-gated **GCP/Firebase** CMS with schema validation and admin-only authentication, letting non-technical staff edit live site content without redeployment and cutting update turnaround from over **2 hours to under 1 minute**.
- Engineered **Apple and Google Wallet** integration with server-side device detection and pass pre-fetching in **Next.js**, serving platform-correct passes to **1,000+** active users across iOS and Android with faster lookup and cold-start in production.
- Cut spam and automated bot emails by over **90%** by implementing a tiered rate-limiting layer, IP-based throttling rules, and token-validation middleware via the **Resend API**, hardening public contact form endpoints and reducing overall server load.

OneChart

Software Engineer Intern

Waterloo, ON, Canada

Jan. 2026 – Apr. 2026

- Built a production Scribe platform and **Chrome extension** used by **50+** clinicians, with role-based permissions, session isolation, and **HIPAA**-aligned handling of protected health data, reducing administrative work across clinical workflows.
- Integrated **Deepgram** and **Gemini APIs** into a real-time **WebSocket** transcription pipeline with sub-**400ms** latency, automatically drafting structured clinical notes that clinicians could review and edit instead of typing them from scratch.
- Engineered a PDF EMR autofill system that uses semantic matching to map patient-note content onto the correct form fields, paired with a live edit UI that syncs changes back to the PDF in real time, cutting **85%** of manual data entry by clinicians.

AvertoAI

Software Engineer Intern

Toronto, ON, Canada

May 2025 – Dec. 2025

- Built a full-stack food-waste reduction platform with **Python** and **FastAPI**, connecting **3** disparate supplier data sources to track and normalize raw purchasing data, helping locations right-size their orders and reduce excess inventory by nearly **25%**.
- Designed and optimized a **PostgreSQL** database schema that removed **1,200+** duplicate supplier records and enforced referential integrity, exposing clean, consistent data to downstream services through a documented set of **RESTful APIs**.
- Improved API response times through database indexing and query optimization, and built a custom **Python** validation layer that enforced business rules on incoming supplier data, catching malformed records before they ever reached the database.

Projects

GreenLens AI | Next.js, TypeScript, Supabase, Recharts | 1st Overall, Data Minds Challenge 2.0

- Built a **6-agent pipeline** evaluating AI carbon, water, license waste, and ROI, automating a previously manual ESG audit.
- Integrated **Microsoft Graph, Google Workspace, and OpenAI APIs** to pull ESG signals automatically, not manually.
- Generated ESG PDF reports using **z-score anomaly detection** and **OLS regression** to flag outliers and surface trends.

A.U.R.A. | Next.js, Three.js, TypeScript, Vultr, PostgreSQL | Best Use of Vultr & Backboard, BearHacks

- Converted detailed floor plans into full 3D environments through a **3-agent AI pipeline** that automated each modeling stage.
- Built a custom **Three.js** viewer with walk mode and object editing, holding sub-**50ms** frame render times in **TypeScript**.
- Deployed on a **Vultr** VPS with Object Storage, **PostgreSQL**, and load balancing to handle **100+** concurrent rendering jobs.

CareSync | React, Node.js, PostgreSQL, Auth0, Vultr | Best Use of Vultr, Hack Canada

- Built a secure full-stack platform with **3** role-based access tiers enforced through **Auth0** and **PostgreSQL** row-level policies.
- Automated medication-risk monitoring across **200+** patient records using nightly cron jobs that flag critical drug interactions.
- Engineered an end-to-end **AI agent** pipeline that auto-generates structured clinical briefings to speed up daily shift handoffs.

Scout | JavaScript, React, Vite, Node.js, Express | Best Use of Backboard, HuskyHacks

- Built a grounded retrieval engine that mines **9+** sources via **Google Search**, deduping and URL-validating every cited result.
- Engineered a persistent memory graph that runs **RAG**-style semantic recall over structured metadata to reuse prior research.
- Synthesized an opportunity gap and build plan with **Gemini**, hardened by **JSON** schema validation, retries, and fallbacks.

Technical Skills

Languages: TypeScript, JavaScript, Python, SQL, Java, R, C, C++, HTML, CSS

Frameworks & Libraries: React, Next.js, Node.js, Three.js, FastAPI, Express, WebSockets, Tailwind CSS

Cloud & Databases: Google Cloud Platform, Firebase, Supabase, PostgreSQL, Vercel, Railway, Vultr, Auth0

Developer Tools: Git, Docker, GitHub Actions, Claude Code, Codex, Gemini, Jira, Linear

Data & ML: pandas, NumPy, scikit-learn, ggplot2
